

Taktstock

Open-source governance for responsible AI-assisted software work

PRIMARY CHALLENGE

Digital Sovereignty & Trusted Data for AI

OPEN-SOURCE REPOSITORY

github.com/massigent/taktstock

The problem

Small civic-tech and mission-driven teams increasingly use AI coding agents without the governance capacity of large organisations. Code and prompts may leave their control, permissions can remain hidden in tool defaults, and agent actions can be difficult to reconstruct or review. Repeated large-model calls and oversized context also create avoidable resource use.

The prototype

1. Versioned project policies for approved tools, data classes, action boundaries and budgets.
2. Explicit human approval linked to visual code diffs before push or merge.
3. Minimised execution evidence recording policy, tool/agent, outcome and human decision without retaining raw prompts or code by default.
4. Digital-sufficiency controls that bound calls and context, making task-appropriate model use visible.

Responsible and sustainable by design

Policies make delegation inspectable; review gates preserve accountability; self-hosting options and minimised records support privacy; and isolated workspaces limit execution scope. Taktstock reports calls, token budgets, retries and context size rather than unsubstantiated emissions figures. It will document trade-offs, including the tension between detailed audit records and privacy, or between local control and the resources required to run it.

Four-month delivery path

- | | |
|----------------|--|
| Month 1 | User interviews, workflow mapping, threat model and public specification |
| Month 2 | Policy manifests, pre-execution checks and approval flows |
| Month 3 | Evidence records, budget/context controls and usability evaluation |
| Month 4 | Open-source pilot release, templates, deployment guide and learning report |

Team

Massimo Gentili leads product, technical architecture and backend implementation. Irma leads user research, UX and validation. Valentina Guariglia leads interaction design, information architecture and pilot experience. Together, the team combines working agent-orchestration software with user-centred, social and environmental design expertise.
